## **Inhibition of p38 Kinase Using Symmetrical and Unsymmetrical Diphenyl Ureas**

15

### **Field of the Invention**

This invention relates to the use of a group of aryl ureas in treating cytokine mediated diseases and proteolytic enzyme mediated diseases, and pharmaceutical compositions for use in such therapy.

20

### **Background of the Invention**

Two classes of effector molecules which are critical for the progression of rheumatoid arthritis are pro-inflammatory cytokines and tissue degrading proteases. Recently, a family of kinases was described which is instrumental in controlling the transcription and translation of the structural genes coding for these effector molecules.

25

The mitogen-activated protein (MAP) kinase family is made up of a series of structurally related proline-directed serine/threonine kinases which are activated either by growth factors (such as EGF) and phorbol esters (ERK), or by IL-1, TNF $\alpha$  or stress (p38, JNK). The MAP kinases are responsible for the activation of a wide variety of transcription factors and proteins involved in transcriptional control of cytokine production. A pair of novel protein kinases involved in the regulation of cytokine synthesis was recently described by a group from SmithKline Beecham (Lee et al. *Nature* 1994, 372, 739). These enzymes were isolated based on their affinity to bond to a class of compounds, named CSAIDSs (cytokine suppressive anti-inflammatory drugs) by SKB. The CSAIDs, bicyclic pyridinyl imidazoles, have been shown to have cytokine inhibitory activity both *in vitro* and *in vivo*. The isolated enzymes, CSBP-1 and -2 (CSAID binding protein 1 and

30

35

2) have been cloned and expressed. A murine homologue for CSBP-2, p38, has also been reported (Han et al. *Science* 1994, 265, 808).

Early studies suggested that CSAIDs function by interfering with m-RNA translational events during cytokine biosynthesis. Inhibition of p38 has been shown to inhibit both cytokine production (eg., TNF $\alpha$ , IL-1, IL-6, IL-8) and proteolytic enzyme production (eg., MMP-1, MMP-3) *in vitro* and/or *in vivo*.

Clinical studies have linked TNF $\alpha$  production and/or signaling to a number of diseases including rheumatoid arthritis (Maini. *J. Royal Coll. Physicians London* 1996, 30, 344). In addition, excessive levels of TNF $\alpha$  have been implicated in a wide variety of inflammatory and/or immunomodulatory diseases, including acute rheumatic fever (Yegin et al. *Lancet* 1997, 349, 170), bone resorption (Pacifci et al. *J. Clin. Endocrinol. Metabol.* 1997, 82, 29), postmenopausal osteoporosis (Pacifci et al. *J. Bone Mineral Res.* 1996, 11, 1043), sepsis (Blackwell et al. *Br. J. USA* 1990, 87, 782; Vyakaram et al. *AIDS* 1990, 4, 21; Badley et al. *J. Exp. Med.* 1997, 185, 55).
- 25 Because inhibition of p38 leads to inhibition of TNF $\alpha$  production, p38 inhibitors will be useful in treatment of the above listed diseases.

A number of diseases are thought to be mediated by excess or undesired matrix-destroying metalloprotease (MMP) activity or by an imbalance in the ratio of the MMPs to the tissue inhibitors of metalloproteinases (TIMPs). These include osteoarthritis (Woessner et al. *J. Biol. Chem.* 1984, 259, 3633), rheumatoid arthritis (Mullins et al.

*Biochim. Biophys. Acta* 1983, 695, 117; Woolley et al. *Arthritis Rheum.* 1977, 20, 1231; Gravallesse et al. *Arthritis Rheum.* 1991, 34, 1076), septic arthritis (Williams et al. *Arthritis Rheum.* 1990, 33, 533), tumor metastasis (Reich et al. *Cancer Res.* 1988, 48, 3307; Matrisian et al. *Proc. Nat'l. Acad. Sci., USA* 1986, 83, 9413), periodontal diseases  
5 (Overall et al. *J. Periodontal Res.* 1987, 22, 81), corneal ulceration (Burns et al. *Invest. Ophthalmol. Vis. Sci.* 1989, 30, 1569), proteinuria (Baricos et al. *Biochem. J.* 1988, 254, 609), coronary thrombosis from atherosclerotic plaque rupture (Henney et al. *Proc. Nat'l. Acad. Sci., USA* 1991, 88, 8154), aneurysmal aortic disease (Vine et al. *Clin. Sci.* 1991, 81, 233), birth control (Woessner et al. *Steroids* 1989, 54, 491), dystrophic  
10 epidermolysis bullosa (Kronberger et al. *J. Invest. Dermatol.* 1982, 79, 208), degenerative cartilage loss following traumatic joint injury, osteopenias mediated by MMP activity, temporomandibular joint disease, and demyelinating diseases of the nervous system (Chantry et al. *J. Neurochem.* 1988, 50, 688).

15 Because inhibition of p38 leads to inhibition of MMP production, p38 inhibitors will be useful in treatment of the above listed diseases.

Inhibitors of p38 are active in animal models of TNF $\alpha$  production, including a murine lipopolysaccharide (LPS) model of TNF $\alpha$  production. Inhibitors of p38 are active in a  
20 number of standard animal models of inflammatory diseases, including carrageenan-induced edema in the rat paw, arachidonic acid-induced edema in the rat paw, arachidonic acid-induced peritonitis in the mouse, fetal rat long bone resorption, murine type II collagen-induced arthritis, and Freund's adjuvant-induced arthritis in the rat. Thus, inhibitors of p38 will be useful in treating diseases mediated by one or more of the  
25 above-mentioned cytokines and/or proteolytic enzymes.

The need for new therapies is especially important in the case of arthritic diseases. The primary disabling effect of osteoarthritis, rheumatoid arthritis and septic arthritis is the progressive loss of articular cartilage and thereby normal joint function. No marketed  
30 pharmaceutical agent is able to prevent or slow this cartilage loss, although nonsteroidal antiinflammatory drugs (NSAIDs) have been given to control pain and swelling. The end result of these diseases is total loss of joint function which is only treatable by joint

replacement surgery. P38 inhibitors will halt or reverse the progression of cartilage loss and obviate or delay surgical intervention.

Several patents have appeared claiming polyarylimidazoles and/or compounds containing polyarylimidazoles as inhibitors of p38 (for example, Lee et al. WO 95/07922; Adams et al. WO 95/02591; Adams et al. WO 95/13067; Adams et al. WO 95/31451). It has been reported that arylimidazoles complex to the ferric form of cytochrome P450<sub>cam</sub> (Harris et al. *Mol. Eng.* 1995, 5, 143, and references therein), causing concern that these compounds may display structure-related toxicity (Howard-Martin et al. *Toxicol. Pathol.* 1987, 15, 369). Therefore, there remains a need for improved p38 inhibitors.

### Summary of the Invention

This invention provides compounds, generally described as aryl ureas, including both aryl and heteroaryl analogues, which inhibit p38 mediated events and thus inhibit the production of cytokines (such as TNF $\alpha$ , IL-1 and IL-8) and proteolytic enzymes (such as MMP-1 and MMP-3). The invention also provides a method of treating a cytokine mediated disease state in humans or mammals, wherein the cytokine is one whose production is affected by p38. Examples of such cytokines include, but are not limited to TNF $\alpha$ , IL-1 and IL-8. The invention also provides a method of treating a protease mediated disease state in humans or mammals, wherein the protease is one whose production is affected by p38. Examples of such proteases include, but are not limited to collagenase (MMP-1) and stromelysin (MMP-3).

Accordingly, these compounds are useful therapeutic agents for such acute and chronic inflammatory and/or immunomodulatory diseases as rheumatoid arthritis, osteoarthritis, septic arthritis, rheumatic fever, bone resorption, postmenopausal osteoporosis, sepsis, gram negative sepsis, septic shock, endotoxic shock, toxic shock syndrome, systemic inflammatory response syndrome, inflammatory bowel diseases including Crohn's disease and ulcerative colitis, Jarisch-Herxheimer reactions, asthma, adult respiratory distress syndrome, acute pulmonary fibrotic diseases, pulmonary sarcoidosis, allergic respiratory diseases, silicosis, coal worker's pneumoconiosis, alveolar injury, hepatic failure, liver disease during acute inflammation, severe alcoholic hepatitis, malaria including *Plasmodium falciparum* malaria and cerebral malaria, non-insulin-dependent diabetes mellitus (NIDDM), congestive heart failure, damage following heart disease,

atherosclerosis, Alzheimer's disease, acute encephalitis, brain injury, multiple sclerosis including demyelation and oligodendrocyte loss in multiple sclerosis, advanced cancer, lymphoid malignancies, tumor metastasis, pancreatitis, including systemic complications in acute pancreatitis, impaired wound healing in infection, inflammation and cancer, 5 periodontal diseases, corneal ulceration, proteinuria, myelodysplastic syndromes, systemic lupus erythematosus, biliary cirrhosis, bowel necrosis, psoriasis, radiation injury, toxicity following administration of monoclonal antibodies such as OKT3, host-versus-graft reactions including ischemia reperfusion injury and allograft rejections including kidney, liver, heart, and skin allograft rejections, lung allograft rejection 10 including chronic lung allograft rejection (obliterative bronchitis) as well as complications due to total hip replacement, and infectious diseases including tuberculosis, *Helicobacter pylori* infection during peptic ulcer disease, Chaga's disease resulting from *Trypanosoma cruzi* infection, effects of Shiga-like toxin resulting from *E. coli* infection, effects of enterotoxin A resulting from *Staphylococcus* infection, 15 meningococcal infection, and infections from *Borrelia burgdorferi*, *Treponema pallidum*, cytomegalovirus, influenza virus, Theiler's encephalomyelitis virus, and the human immunodeficiency virus (HIV).

The present invention, therefore, provides compounds generally described as aryl ureas, 20 including both aryl and heteroaryl analogues, which inhibit the p38 pathway. The invention also provides a method for treatment of p38-mediated disease states in humans or mammals, e.g., disease states mediated by one or more cytokines or proteolytic enzymes produced and/or activated by a p38 mediated process. Thus, the invention is directed to compounds and methods for the treatment of diseases mediated by p38 kinase 25 comprising administering a compound of Formula I

The present invention is also directed to pharmaceutically acceptable salts of formula I. Suitable pharmaceutically acceptable salts are well known to those skilled in the art and  
 15 include basic salts of inorganic and organic acids, such as hydrochloric acid, hydrobromic acid, sulphuric acid, phosphoric acid, methanesulphonic acid, sulphonic acid, acetic acid, trifluoroacetic acid, malic acid, tartaric acid, citric acid, lactic acid, oxalic acid, succinic acid, fumaric acid, maleic acid, benzoic acid, salicylic acid, phenylacetic acid, and mandelic acid. In addition, pharmaceutically acceptable salts include acid salts of  
 20 inorganic bases, such as salts containing alkaline cations (e.g.,  $\text{Li}^+$   $\text{Na}^+$  or  $\text{K}^+$ ), alkaline earth cations (e.g.,  $\text{Mg}^{+2}$ ,  $\text{Ca}^{+2}$  or  $\text{Ba}^{+2}$ ), the ammonium cation, as well as acid salts of organic bases, including aliphatic and aromatic substituted ammonium, and quaternary ammonium cations, such as those arising from protonation or peralkylation of triethylamine, *N,N*-diethylamine, *N,N*-dicyclohexylamine, pyridine, *N,N*-

### General Preparative Methods

- 5 The compounds of Formula I may be prepared by use of known chemical reactions and procedures, some from starting materials which are commercially available. Nevertheless, the following general preparative methods are presented to aid one of skill in the art in synthesizing these compounds, with more detailed particular examples being presented in the experimental section describing the working examples.

### **Scheme I     Reduction of Nitroaryls to Aryl Amines**

Nitroaryls are commonly formed by electrophilic aromatic nitration using  $\text{HNO}_3$ , or an alternative  $\text{NO}_2^+$  source. Nitroaryls may be further elaborated prior to reduction. Thus,

- 15 nitroaryls substituted with

potential leaving groups (eg. F, Cl, Br, etc.) may undergo substitution reactions on treatment with nucleophiles, such as thiolate (exemplified in Scheme II) or phenoxide. Nitroaryls may also undergo Ullman-type coupling reactions (Scheme II).

### Scheme II Selected Nucleophilic Aromatic Substitution using Nitroaryls

Nitroaryls may also undergo transition metal mediated cross coupling reactions. For example, nitroaryl electrophiles, such as nitroaryl bromides, iodides or triflates, undergo palladium mediated cross coupling reactions with aryl nucleophiles, such as arylboronic acids (Suzuki reactions, exemplified below), aryltins (Stille reactions) or arylzincs (Negishi reaction) to afford the biaryl (5).

10

Either nitroaryls or anilines may be converted into the corresponding arenesulfonyl chloride (7) on treatment with chlorosulfonic acid. Reaction of the sulfonyl chloride with a fluoride source, such as KF then affords sulfonyl fluoride (8). Reaction of sulfonyl fluoride 8 with trimethylsilyl trifluoromethane in the presence of a fluoride source, such as tris(dimethylamino)sulfonium difluorotrimethylsiliconate (TASF) leads to the corresponding trifluoromethyl sulfone (9). Alternatively, sulfonyl chloride 7 may be reduced to the arene thiol (10), for example with zinc amalgam. Reaction of thiol 10 with CHClF2 in the presence of base gives the difluoromethyl mercaptam (11), which may be oxidized to the sulfone (12) with any of a variety of oxidants, including CrO3-acetic anhydride (Sova et al. *Zh. Org. Khim.* 1970, 6, 568).

**Scheme III** ~~Synthesized~~ Methods of Fluorinated Aryl Sulfone Synthesis

As shown in Scheme IV, non-symmetrical urea formation may involve reaction of an aryl isocyanate (14) with an aryl amine (13). The heteroaryl isocyanate may be synthesized from a heteroaryl amine by treatment with phosgene or a phosgene equivalent, such as trichloromethyl chloroformate (diphosgene), bis(trichloromethyl) carbonate (triphosgene), or *N,N'*-carbonyldiimidazole (CDI). The isocyanate may also be derived from a heterocyclic carboxylic acid derivative, such as an ester, an acid halide or an anhydride by Curtius-type rearrangement. Thus, reaction of acid derivative 16 with an azide source, followed by rearrangement affords the isocyanate. The corresponding carboxylic acid (17) may also be subjected to Curtius-type rearrangements using diphenylphosphorazide (DPPA) or a similar reagent.

### EXAMPLES

20 All reactions were performed in flame-dried or oven-dried glassware under a positive pressure of dry argon or dry nitrogen, and were stirred magnetically unless otherwise indicated. Sensitive liquids and solutions were transferred via syringe or cannula, and introduced into reaction vessels through rubber septa. Unless otherwise stated, the term 'concentration under reduced pressure' refers to use of a Buchi rotary evaporator at

Thin-layer chromatography (TLC) was performed using Whatman® pre-coated glass-backed silica gel 60A F-254 250 µm plates. Visualization of plates was effected by one or more of the following techniques: (a) ultraviolet illumination, (b) exposure to iodine vapor, (c)

immersion of the plate in a 10% solution of phosphomolybdic acid in ethanol followed by heating, (d) immersion of the plate in a cerium sulfate solution followed by heating, and/or (e) immersion of the plate in an acidic ethanol solution of 2,4-dinitrophenylhydrazine followed by heating. Column chromatography (flash chromatography) was performed using 230-400 mesh EM Science® silica gel.

The ion source was maintained at 250 °C. Electron impact ionization was performed with electron energy of 70 eV and a trap current of 300  $\mu\text{A}$ . Liquid-caesium secondary ion mass spectra (FAB-MS), an updated version of fast atom bombardment were obtained using a Kratos Concept 1-H spectrometer. Chemical ionization mass spectra (CI-MS) were obtained using a Hewlett Packard MS-Engine (5989A) with methane or ammonia as the reagent gas ( $1 \times 10^{-4}$  torr to  $2.5 \times 10^{-4}$  torr). The direct insertion desorption chemical ionization (DCI) probe (Vacumetrics, Inc.) was ramped from 0-1.5 amps in 10 sec and held at 10 amps until all traces of the sample disappeared ( $\sim 1$ -2 min). Spectra were scanned from 50-800 amu at 2 sec per scan. HPLC - electrospray mass spectra (HPLC ES-MS) were obtained using a Hewlett-Packard 1100 HPLC equipped with a quaternary pump, a variable wavelength detector, a C-18 column, and a Finnigan LCQ ion trap mass spectrometer with electrospray ionization. The resulting precipitate was washed with EtOAc to provide the title compound (0.13 g): <sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ 2.24 (s, 3H), 7.44-7.03 (m, 6H), 8.46 (s, 1H), 8.60 (d, *J*=1.8 Hz, 1H), 9.16 (s, 1H), 10.41 (s, 1H); FAB-MS *m/z* 343 ((M+1)<sup>+</sup>). This material was used in the next step without purification.

- 15 Step 2. *N*-(2-Methoxy-5-(trifluoromethylthio)phenyl)-*N'*-(4-methylphenyl)urea:** A solution of *N*-(2-hydroxy-5-(trifluoromethylthio)phenyl)-*N'*-(4-methylphenyl)urea (0.125 g, 0.36 mmol), iodomethane (0.045 mL, 0.73 mmol), and K<sub>2</sub>CO<sub>3</sub> (100 mg, 0.73 mmol) in acetone (2 mL) was heated at the reflux temp. for 6 h, then was cooled to room temp. and concentrated under reduced pressure. The residue was dissolved in a minimal amount of MeOH, absorbed onto silica gel, and then purified by flash chromatography (3% Et<sub>2</sub>O/97% CH<sub>2</sub>Cl<sub>2</sub>) to provide the title compound as a white solid (68 mg): <sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ 2.22 (s, 3H), 3.92 (s, 3H), 7.05-7.32 (m, 6H), 8.37 (s, 1H), 8.52 (d, *J*=2.2 Hz, 1H), 9.27 (s, 1H); FAB-MS *m/z* 357 ((M+1)<sup>+</sup>).

## C2. General Method for the Reduction of Nitro-Containing Ureas

***N*-(5-*tert*-Butyl-2-methoxyphenyl)-*N'*-(2-amino-4-methylphenyl)urea:** A solution of *N*-(5-*tert*-butyl-2-methoxyphenyl)-*N'*-(2-nitro-4-methylphenyl)urea (prepared in a manner analogous to Method B1a; 4.0 g, 11.2 mmol) in EtOH (100 mL) was added to a slurry of 10% Pd/C (0.40 g) in EtOH (10 mL), and the resulting mixture was stirred under an atmosphere of H<sub>2</sub> (balloon) at room temp. for 18 h. The mixture was filtered through a pad of Celite® and concentrated *in vacuo* to afford the desired product (3.42 g, 94%) as a powder: mp 165-166 °C; <sup>1</sup>H-NMR (DMSO-*d*<sub>6</sub>) δ 1.30 (s, 9H), 2.26 (s, 3H), 3.50 (br s, 2H), 3.71 (s, 3H), 6.39 (br s, 1H), 6.62 (s, 1H), 6.73 (d, *J*=8.46 Hz, 1H), 6.99 (dd, *J*=2.21, 8.46 Hz, 1H), 7.05 (d, *J*=8.46 Hz, 1H), 7.29 (s, 1H), 8.22 (d, *J*=2.57 Hz, 1H); FAB-MS *m/z* 328 ((*M*+H)<sup>+</sup>).

## C3. General Method of Thiourea Formation by Reaction with a Thioisocyanate

### BIOLOGICAL EXAMPLES

#### P38 Kinase Assay:

- 5 The *in vitro* inhibitory properties of compounds were determined using a p38 kinase inhibition assay. P38 activity was detected using an *in vitro* kinase assay run in 96-well microtiter plates. Recombinant human p38 (0.5 µg/mL) was mixed with substrate (myelin basic protein, 5 µg/mL) in kinase buffer (25 mM Hepes, 20 mM MgCl<sub>2</sub> and 150 mM NaCl) and compound. One µCi/well of <sup>32</sup>P-labeled ATP (10 µM) was added to a final

volume of 100  $\mu$ L. The reaction was run at 32 °C for 30 min. and stopped with a 1M HCl solution. The amount of radioactivity incorporated into the substrate was determined by trapping the labeled substrate onto negatively charged glass fiber filter paper using a 1% phosphoric acid solution and read with a scintillation counter. Negative controls include  
5 substrate plus ATP alone.

All compounds exemplified displayed p38 IC<sub>50</sub>s of between 1 nM and 10  $\mu$ M.

LPS Induced TNF $\alpha$  Production in Mice:

10 The *in vivo* inhibitory properties of selected compounds were determined using a murine LPS induced TNF $\alpha$  production *in vivo* model. BALB/c mice (Charles River Breeding Laboratories; Kingston, NY) in groups of ten were treated with either vehicle or compound by the route noted. After one hour, endotoxin (E. coli lipopolysaccharide (LPS) 100  $\mu$ g) was administered intraperitoneally (i.p.). After 90 min, animals were  
15 euthanized by carbon dioxide asphyxiation and plasma was obtained from individual animals by cardiac puncture into heparinized tubes. The samples were clarified by centrifugation at 12,500 x g for 5 min at 4 °C. The supernatants were decanted to new tubes, which were stored as needed at -20 °C. TNF $\alpha$  levels in sera were measured using a commercial murine TNF ELISA kit (Genzyme).
